

**NAME**

curl\_multi\_add\_handle - add an easy handle to a multi session

**SYNOPSIS**

```
#include <curl/curl.h>
```

```
CURLMcode curl_multi_add_handle(CURLM *multi_handle, CURL *easy_handle);
```

**DESCRIPTION**

Adds a standard easy handle to the multi stack. This will make this multi handle control the specified easy handle.

When an easy handle has been added to a multi stack, you can not and you must not use curl\_easy\_perform() on that handle!

**RETURN VALUE**

CURLMcode type, general libcurl multi interface error code.
