

NAME

curl_version - returns the libcurl version string

SYNOPSIS

```
#include <curl/curl.h>
```

```
char *curl_version();
```

DESCRIPTION

Returns a human readable string with the version number of libcurl and some of its important components (like OpenSSL version).

Note: this returns the actual running lib's version, you might have installed a newer lib's include files in your system which may turn your `LIBCURL_VERSION` #define value to differ from this result.

RETURN VALUE

A pointer to a zero terminated string.

SEE ALSO

The `LIBCURL_VERSION` #define in `<curl/curl.h>`

BUGS

Surely there are some, you tell me!
